Vertical Gardening

Turn those leftover soda bottles into a vertical garden with some supplies and a bit of crafting skills. Do it yourself!

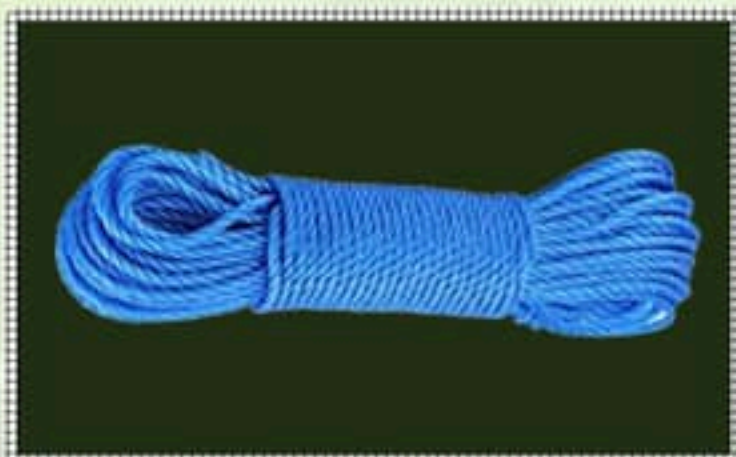

Materials needed:

two-liter or any plastic bottle,
empty and clean

Scissors

Clothesline rope, twine, or
wire

Washers (two per bottle if
rope or wire is chosen)

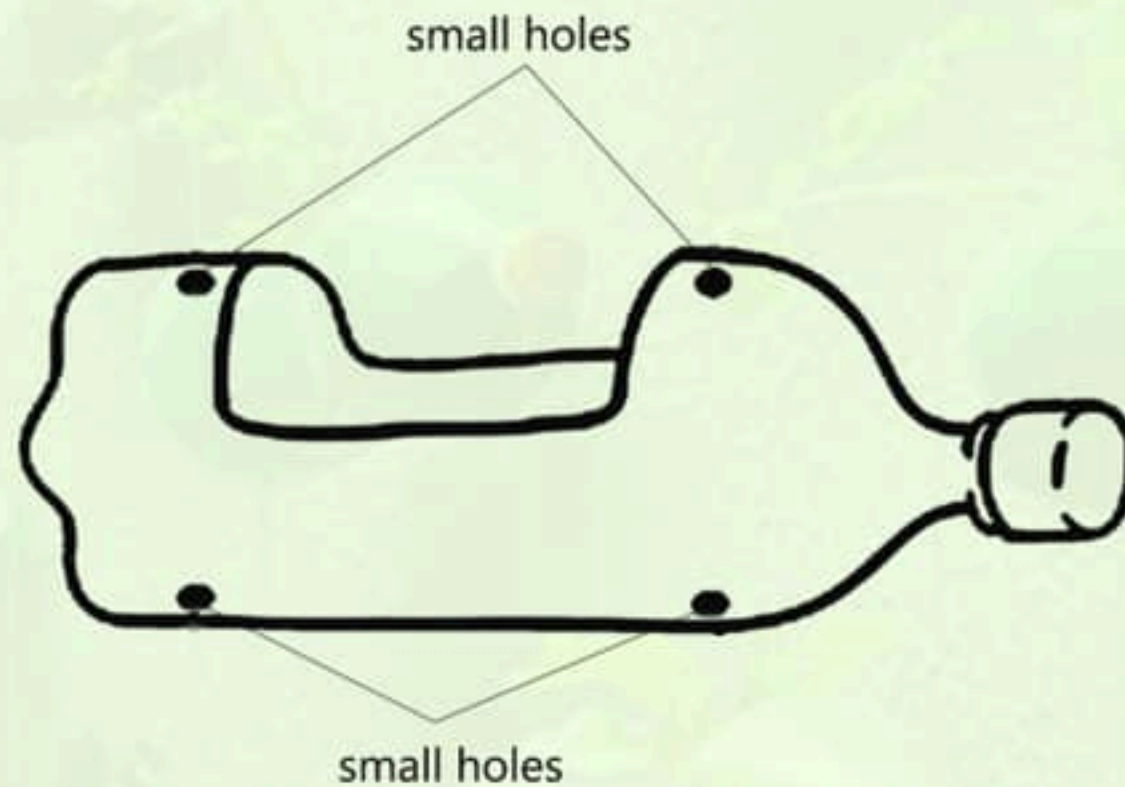

Dirt/soil media

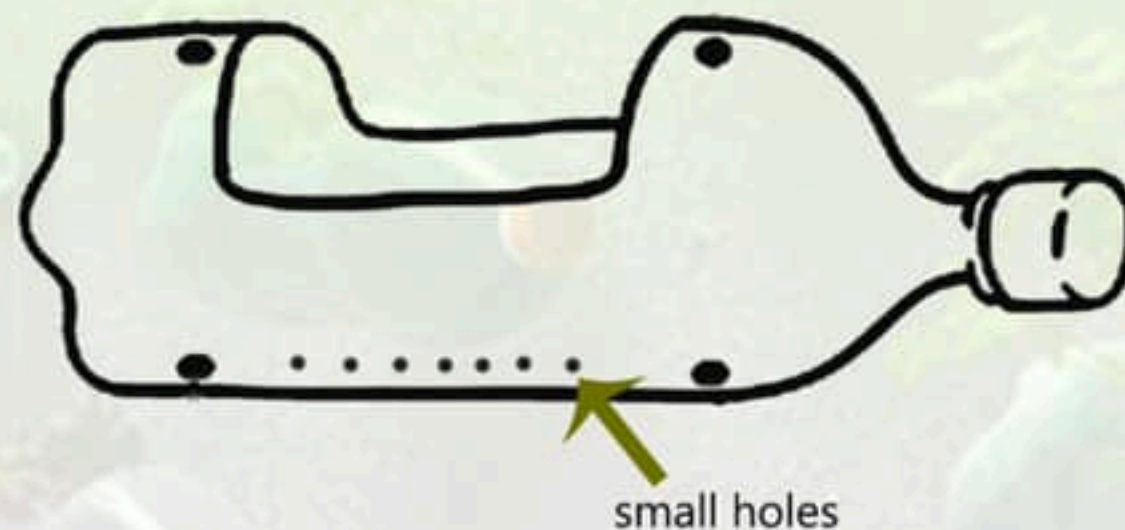

Seedlings

Instructions:

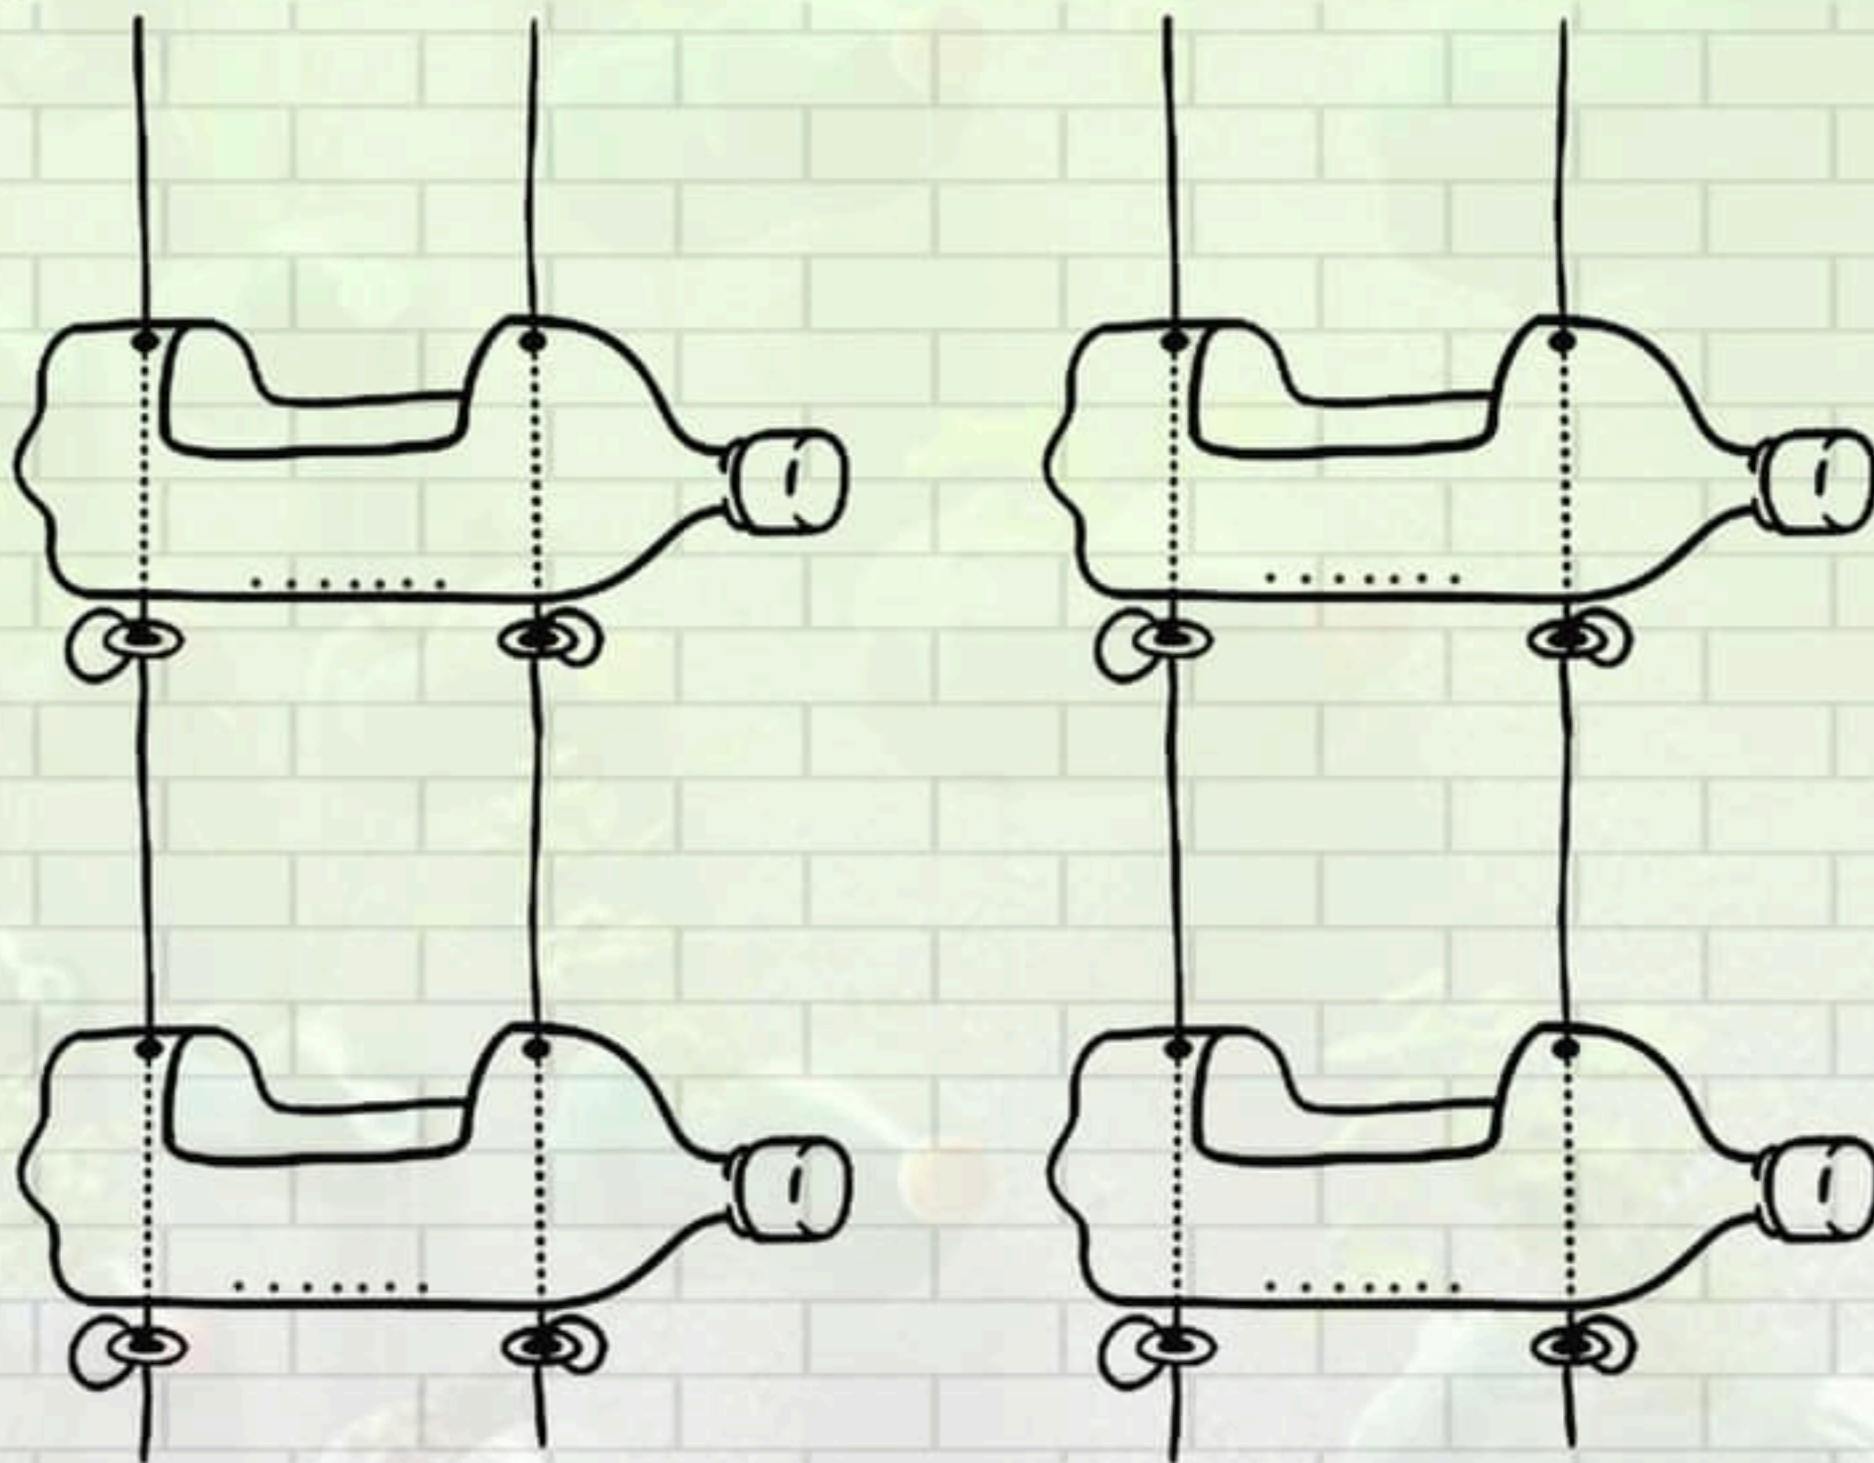

To secure the bottles, you must make two holes at the bottom of the cylinder and another two at the top of the bottle.

In addition to the holes to pass the rope, you need a small hole in the bottom of the bottle. The water used to irrigate the seedling needs to drain.

Instructions:

After that, thread the string through a hole and pull out through the other.

Many people have asked how to make sure the bottles do not “slip” on the rope (or string or cordage). Either tie a large knot in the rope or tie the knot around a washer. Then simply stretch and attach the rope to the wall.
